A Cost and noise regions of the admission rule
RRSI preprint [Xia et al.]
regularized -> unregularized
Δs = −3.3, Δc = +1.38M tok/trial
rejected
by G6
rejected by G6
(cost above slope)
slope κ
rejected by G5
Δs < −τ
admissible only
if Δc < 0
admissible
Δc ≤ κ Δs
τ = 1.0, κ = 0.25 M/pt: illustrative, not measured
Δc token cost change (M tokens per trial)
Δs held-out score change (points)
B Cumulative regressions on P
ungated, m > 0
NOT YET MEASURED
External reference: of 383 proposals that a replay gate rejected,
211 (55%) fixed their trigger and broke a passing case
[Tayebati et al., preprint, not replicated]
gated, m = 0: no admitted change loses a case beyond δ(x)
(a property of predicate G4, not a measurement)
cumulative cases lost on protected set P
candidates proposed (index)
